Task 2: Planning for Performance

.

Goal setting

Health Goal-

Specific	Through planned mental training sessions centered on mindfulness, visualization, deep breathing, and gradual muscular relaxation, The goal is to improve my client's mental health and emotional control by reducing her anxiety and enhancing her capacity to cope in her high jump performance. These techniques are intended to control her arousal levels, enhance her confidence and concentration, and lessen the detrimental effects of stress and excessive social media use on her training and competing performance.
Measurable	I am for my client to improve her coping ability on the ASCI test from 35 (moderately low) to 40-45 (average to moderately high coping ability), demonstrating better emotional regulation and stress management. As evidenced by post-session reflections and observed gains in concentration, self-assurance and emotional control in training and competitive **environments.**
Achievable	This goal is achievable since my client is actively involved in sports and does not exhibit based on baseline ACSI results and training observations, displays consistent mental preparedness and controllable levels of competitive stress, making it possible to improve her coping skills and anxiety management. The coping mechanisms used like breathing exercises, visualization, and mindfulness, are time-efficient, validated by science and suitable for my client to perform post-physical sessions.
Relevant	This goal is extremely relevant to high jump performance since increased anxiety can have a detrimental impact on the approach rhythm, timing, takeoff mechanics, and overall confidence in competitive **environments**. It is crucial to lower her anxiety levels, which lowers her arousal, that causes her to breath more slowly and reduce the rate of her heart rate, activating her parasympathetic nervous system (PNS), making it easier for her to stay focused and in control of her high jump performance.
Timely	My goal is to achieve this SMART goal by February 3rd with a goal of 8 sessions completed over the course of 5 weeks, with each session having a duration of 10 minutes. This goal will be accomplished by making effective and efficient sessions that are in a controlled and quiet **environment.** After every session, my client will write a reflection to share her thoughts on how her mindfulness and anxiety have improved.

Physical Goal-

Specific	To improve my client's height in high jump, by developing lower-body muscular power and thoracic spine and hip flexibility can improve my client's take-off and flight phase during her high jump performance. Additionally, she needs to perform these in a **motivating environment** that pushes her to optimize her performance to the fullest.
Measurable	Improving my client's height in her high jump performance by 0.05m. Going from 1.25m to 1.30m. For her fitness tests, her goal is to increase her 30m sprint by 0.2s (5.25s-5.23), the vertical jump test by 2cm (33cm-35cm), the standing long jump by 0.02m (1.82m-1.84m), and the sit and reach by 4cm (23cm-27cm)
Achievable	Her goal is achievable because through a structured 8 session over the course of 5 weeks includes plyometric exercise, resistance training for the legs, and targeted dynamic and static stretching for the thoracic spine and hips. Which is realistic but challenging enough to motivate her to push harder in her training sessions. I've found a lot of shortcomings in her technique, so she is expected to improve her muscle power in both the take-off and flight phase in high jump by completing both plyometric and resistance training. Moreover, combining dynamic and static stretching for the thoracic spine and hip can increase her flexibility to lessen the risk of bar contact and achieve a height of 1.30m
Relevant	This goal is relevant to high jump, since maintaining an effective flight posture will lower the chance of bar contact depending on hip and thoracic spine flexibility, while muscular power is necessary to generate explosive power to generate explosive force during take-off. Enhancing these elements will directly improve her capacity to consistently perform in training and competitive **environments** and break higher barriers.
Timely	My goal is to achieve this SMART goal by February 3rd with a goal of 8 session completed over the course of 5 weeks, with each session having a duration of 50 minutes including warm-up and cool-down. This goal will be accomplished by making effective and efficient plans. After every session, my client will write a reflection to share her thoughts on how her technique and fitness components (muscular power and strength) have improved.

FITT and SPORT Principles

Frequency- Frequency is how often you exercise. It is recommended that you should exercise at least at a moderate level for 30 minutes per day to maintain or gain physical fitness (Laskowski, 2023). Make sure to spread out the amount of exercise per week instead of completing it all in one day. It is important to take rest days for the body to recover from the intense exercise. In my training plan, I included the principal 'frequency' as my client will be performing 8 sessions over the course of 5 weeks. Intensity-Intensity is how hard you exercise and train. The quantity of reps, sets, or even weights can change that (Physiopedia, 2022). It is necessary to progressively increase the intensity of the workout to make it more difficult and demanding for the muscles if the goal is to employ the principle of "intensity" to raise overall fitness levels. Your body is forced to do more than usual as a result, which makes the muscles work harder and enable them to adjust to the increased weight, eventually making it easier for them to list the greater weight. Since I will be raising the weights and reps my client lifts to put more strain on her muscles and raise the overall intensity of the training session, I added the principal "intensity" in my training plan. Time- Time is the duration of your exercising and training in that one session (Physiopedia, 2022). Training sessions should continue at least an hour in total, while increasing, as it promotes better muscle growth and neuromuscular adaptation, both of which are necessary for the high jump's explosive motions. Increased training time also increases the effectiveness of each session by strengthening key muscle groups like the gluteal, quadriceps, hamstrings, and calves as well as offering chances to practice and improve crucial technical aspects like the curved approach, takeoff mechanics, and body control during flight. In order to give my client enough time to develop flexibility, muscular power, and strength as well as enhancing the explosiveness in her take-off and her flexibility in the thoracic spine extension during the flight phase. This is a vital element for a successful high jump performance, I have incorporated the training concept of time into my training plan by making sure each session lasts roughly an hour. Type- Type is the variety of exercises you do (Physiopedia, 2022). Strength, plyometric, and skill-based training are all distinct forms of exercise that are intended to improve particular aspects of athletic performance. To properly target the muscles and skills needed for the high jump, it's critical to do the right kind of training. Performance gains will be restricted if the wrong kind of training is employed since the main muscles involved won't be sufficiently developed since my client needs to improve her thoracic spine extension and take-off mechanics which are necessary for a successful high jump performance. I have incorporated the training principle of type into my training plan by primarily alternating between a variety of training methods.

Specificity- Making your training directly relevant to your sport and the specific area of fitness you want to improve is known as specificity (BBC Bitesize, 2012). This entails practicing the proper muscles groups, body parts, and technical motions needed to

achieve a high leap. Improvements will be minor if training is not tailored to the sports since the essential muscles and movements patterns required for the high jump will not be fully developed. Additionally, it's critical to start training at the right level because too complex programs might raise the risk of injury and demotivate participants. By concentrating on the precise muscle groups necessary for the high jump, such as the gluteal, quadriceps, hamstrings, and calves, as well as technical aspects like the approach run, takeoff, and bar clearance technique, I have incorporated the training principle of specificity into my training regimen. By using proper technique in addition to more explosive power, this enables my client to improve her performance. Progression- the progressive increase in training volume or intensity over time is known as progression (BBC Bitesize, 2012). Exercise should be started gradually and increased only when the body has adjusted to the prior burden, which is referred to as overloading. Overloading forces muscles to grow, adapt, and reach their maximal strength potential, making the athlete more potent. I have included the notion of progression into my training plan by progressively increasing my client's weights and sets in each session, but only after making sure her muscles have adequately adapted to the prior load. This method guarantees a consistent increase in strength, allowing the muscles to produce greater power efficiency. Overload- Overload occurs when you put more strain on your body than it typically would in order to progressively get better (BBC Bitesize, 2012). You may incorporate overload into your training plan in three different ways: by increasing exercise frequency, intensity, and length. These are the first three FITT principles (frequency, intensity, and time), as you may have noted. By using these guidelines, you can alter the level of difficulty of your workout, making your muscles work harder and adapt more quickly, which will ultimately increase their strength and power. By raising the intensity, I incorporated the principle of "overload" into my training regimen. In order to avoid injuries and enable further advancement, I gradually increased the weights and sets utilized for each workout by a tiny amount, teaching my client's muscles to adapt and grow stronger. Reversibility- the concept of reversibility states that if training is discontinued, any adaptations acquired during training may be lost (BBC Bitesize, 2012). Regular training is crucial since gaining muscle takes longer than losing it. Fitness levels may drop back to where they were before training started if a significant rest is taken. I used the reversibility concept in my training regimen by making sure that my client trains consistently for 8 sessions over the course of three weeks. I alternated between skill-based and strength training, giving my client an equal amount of downtime in between. This strategy aided my client to sustain the improvement I've made by allowing her muscles ample time to heal without requiring lengthy rests. Tedium- the idea of adopting a range of training techniques and exercises to keep athletes motivated and avoid boredom is known as tedium (BBC Bitesize, 2012). Athletes are more likely to remain involved when training sessions are varied, which can enhance enjoyment, effort, and overall performance. I used the notion of tedium in my training plan for my client by incorporating a variety of exercises and making sessions more pleasurable in order to maintain her motivation. An increase in motivation promotes regular training and concentrated practice of particular approaches that directly improve my client's performance; thus, this strategy will improve her outcomes in a competitive **environment**.

Innovative tools to be used to track and monitor performance

Technology plays a massive role in aiding my client improve her high jump performance, particularly in terms of monitoring development and polishing technique. By employing **digital** tools, like the **digital** application WHOOP, to track and monitor her performance can capture vital data including sleep quality, heart rate, and recuperation, which are crucial for maximizing training and avoiding the possibility of overtraining. Additionally, **digita**l societies can affect motivation, focus, and general mental health, so to minimize the impact, I will monitor her screen time and social media usage via her phone screen time. By examining these trends, enables me as a coach to suggest ways to reduce unnecessary screen usage, fostering a positive **digital environment** that promotes improved **communication, interactions, and relationships** on and off the pitch.

Physical health training is just as important as mental health training, which is why a section of each session will be dedicated to each training. Make sure in the physical health sessions to rest 1 minute to 2 minutes in between sets. Make sure for each health session, find a quiet and controlled **environment** in which you **interact** with yourself only.

Training Program (Sessions 1 through 4):

Session 1: Skill-based, Static Plyometrics, and Dynamic training + Breathing Techniques	Session 2: Resistance, Dynamic Plyometrics, and Static training + Progressive muscular relaxation For weights go for 6-8kg	Session 3: Skill-based, Static, Dynamic and Plyometrics, + Mindfulness training	Session 4: Resistance, Dynamic Plyometrics, and Static training + Visualization /For weights go for 4-5kg
Warm-up (10mins)-> light jog around the track, 2 laps, 3 minutes - Dynamic stretches, 7minutes, 3x10: leg swings each leg, arm swings each arm, A-skips, B-skips Main Workout (30 minutes)-> Technical drills: curved approach run drills-5x2, penultimate step drills-4x2, Take-off arm drive drills-4x2. Plyometric training: short-approach jumps -6x2 Cool-down (10 mins)-> https://www.youtube.com/watch?v=BGBXZHu7jBY	Warm-up (10 mins)->Skipping rope, 5 minutes - Dynamic mobility, 5 minutes - 3x10: A-skips, high knees, thoracic rotations. Main Workout (30 mins)-> Resistance: trap bar deadlift, 4x4, explosive step-ups, 3x6 each leg, Plyometric circuit: depth jumps, 3x5, tuck jumps, 3x6, lateral bounds, 3x8 Cool-down (10 mins)-> https://www.youtube.com/watch?v=BGBXZHu7jBY	Warm-up (10mins)->light jog around the track, 3 laps, 4 minutes - Dynamic mobility 6 minutes, 3x10: bounding, carioca, thoracic rotations. Main Workout (30 minutes)-> Technique training: Scissor jumps (low bar)- 6x2, back arch drills on mat- 5x2, head and arm position drills-4x2. Plyometric training: Medium-approach jumps 6-8x2 Cool-down (10 mins)-> https://www.youtube.com/watch?v=BGBXZHu7jBY	Warm-up(10mins)-> Light jog on treadmill 3 minutes - Dynamic stretches, 7 minutes- 3x10: leg swings each leg, hip openers, walking lunges with thoracic rotation Main Workout (30 mins)-> Resistance: Back squat, Romanian deadlift; 3x6, Bulgarian split squat 3x8 / Plyometric training: box jumps 3x5, single-leg bounds 3x10m Cool-down (10 mins)-> https://www.youtube.com/watch?v=BGBXZHu7jBY
Duration (10minutes)-> 1) sit upright or lie down in a relaxed position 2) place on the chest and one on the stomach 3) inhale slowly through the nose for 4 seconds, feeling the stomach rise 4) exhale slowly through the mouth for 6 seconds, feeling the stomach fall. 5) Maintain a steady breathing rhythm throughout the session 6) focus attention solely on the breath 7) notice a reduction in heart rate and tension 8)	Duration (10minutes)-> 1) sit or lie down comfortably in a quiet space 2) take slow, deep breaths to prepare the body for relaxation 3) tense the calf muscles for 5 seconds, then relax for 10 seconds 4) repeat the process with the thighs and gluteal muscles 5) tense the abdominal and lower back muscles, then relax 7) tense the neck and facial muscles, then relax 8) focus on the sensation of relaxation throughout the body 9)	Duration (10minutes)-> 1) sit comfortably in a quiet, distraction-free **environment** 2) close your eyes and focus on natural breathing 3) bring awareness to body sensations and posture 4) gently redirect focus back to the breath when distracted 6) remain present in the moment throughout the session 7) acknowledge feelings of anxiety or stress calmly 8) continue slow, controlled	Duration (10minutes)-> 1) Sit or lie in a comfortable position, in the environment 2) close your eyes and take 3-4 slow, deep breaths in order to relax the body 3) Begin visualizing a perfect jump approach, where you cross over the bar smoothly and in control 4) mentally rehearse a powerful and confident take-off 5) imagine an effective flight phase with good hip height and thoracic spine extension 6) visualize a safe

continue for several breathing cycles 9) end the session with a calm, relaxed posture Breathing Technique	continue slow breathing to maintain a calm state (Nunez)	breathing 9) gradually return attention to the surroundings Mindfulness Technique	and controlled landing on the mat 7) focus on feelings of confidence, calmness, and success 8) slowly open your eyes and return attention to the **environment.**

Interim performance analysis

Type of fitness test	Test 1	Test 2	Test 3	Average	Change from inital
Sit and reach test	28cm	28cm	27cm	27.5cm	+4.5cm
Vertical jump test	0.41m	0.35m	0.32m	0.36m	+0.03m
Standing long jump	1.80m	1.80m	1.83m	1.81m	-0.01m
30m Sprint test	00.05.23	00.05.24	00.05.25	00.05.24	+00.0.10
High jump	1.26m	1.27m	1.28m	1.27m	+0.02m

Type of Health test	Score	Change from initial
ASCI	39	+4
BSMASS(addiction)	Moderate	High to Moderate

The client's flexibility, speed, explosive power, and event-specific performance have all clearly improved throughout the course of the interim fitness tests. Improved flexibility and mobility, which promote injury prevention and flexion in the thoracic spine, was demonstrated by a notable increase in the sit and reach test (+4.5cm). enhanced lower-body power and improved technical execution during takeoff are shown by improvements in the vertical jump (+0.03m) and high jump (+0.02m). furthermore, the 30m speed test showed an 00.0.10 second improvement, indicating a successful development of acceleration and sprint mechanics that enhance the approach in high jump performance, however, can still be improved to achieve a 20-millisecond difference from initial, by consistently incorporating sprint exercises for high jump. The standing long jump did, however, reveal a little fall (-0.01m), which may indicate mild weakness or a slight reduction in horizontal power output. More horizontal plyometric workouts and focused lower-body strength training will be added in the following training phase to face this problem. Overall, the finding indicate that the training program is successful, however minor modifications are needed to guarantee balanced performance improvement and ongoing advancement towards the client's SMART goals.

In terms of the mental health aspect, my client has clearly improved in every psychological category evaluated, demonstrating the efficacy of the mental training techniques employed. Her ACI score rose to 39, a +4 improvement from the initial test, indicating improved emotional regulation, self-assurance, and pressure tolerance. Additionally, she showed increased self-regulation and a decrease in negative or compulsive behaviors, as evidenced by her BSMASS addiction score, which went from a high to moderate addiction. Her ASCI score has to rise by +1 in order to enter the higher range of (40-45) to show the best psychological preparedness and consistency, therefore there is still opportunity for progress. Additionally, she needs to make more work in order to lower her BSMASS score into a lower addition category. This will include ongoing attention to mental methods, habit management, and reflective practices. All things considered, the data indicates that his mental SMART goal is still attainable while continuing to be difficult and inspiring for the following training sessions

Training Program (Sessions 6 through 8):

Session 5: Elastic plyometrics+ Skill-based (technical) + dynamic mobility and static training + Positive reinforcement	Session 6: Resistance, Dynamic, Plyometrics, and Static training + Brown Noise /For weights go for 6-8kg	Session 7: Strength, Power Transfer, static, and dynamic training + Meditation / For weights go for 8-10kg	Session 8: Skill-based, static, dynamic and reactive plyometric training + Visualization
Warm-up(10 mins)->Light jog around track, 3 minutes – Dynamic mobility, 7 minutes: 3x8: ankle hops, leg swings, hip openers, A-skips. Main Workout (30 mins)->Elastic plyometrics: Pogo jumps (ankle stiffness focus), 3x20, straight -leg bounds, 3x20m, lateral skater jumps, 3x8. Take-off & Flight phase drills: Penultimate step pop-ups, 4x2, Single-leg take-off jumps, 4x3, back arch drills on mat, 4x2 Cool-down (10 mins)-> https://www.youtube.com/watch?v=BGBXZHu7jBY	Warm-up(10mins)-> Light jog on treadmill 4 minutes - Dynamic stretches, 6 minutes- 2x12: monster walks, leg swings, ankle hops, arm circles Main Workout (30 mins)-> Resistance: Barbell hip thrust 2x6, Goblet squat; 3x6, Bulgarian split squat 3x8 / Plyometric training: Jump squats (Light load) 3x5 Cool-down (10 mins)-> https://www.youtube.com/watch?v=BGBXZHu7jBY	Warm-up (10mins)-> light jog on treadmill, 3 minutes - Dynamic stretches, 7 minutes, 3x10: leg swings each leg, arm swings each arm, hip openers , walking lunges Main Workout (30 minutes)-> Strength: Single-leg Romanian deadlift, 3x6 each leg, Step-ups with knee drive, 3x6 each leg, Bulgarian split squats 2x8 Power and Stability: Box jumps, 2x5, Med-ball overhead throws, 3x6 Cool-down (10 mins)-> https://www.youtube.com/watch?v=BGBXZHu7jBY	Warm-up (10mins)->light jog around the track, 3 laps, 4 minutes - Dynamic mobility 6 minutes, 3x10: bounding, carioca, thoracic rotations. Main Workout (30 minutes)-> Technique training: arch back drop on mat,, 6-8 jumps x 2, take-off accuracy drills (mark check), 4x2, bar-clearance shape drills, 4x2. Reactive Plyometric training: Depth drops (low height, 3x5) Cool-down (10 mins)-> https://www.youtube.com/watch?v=BGBXZHu7jBY
Duration (Throughout the training session)->1.During training, acknowledge gains in effort, technique and consistency 2. Give precise praise to yourself by stating exactly what went well to boost internal confidence 3. To stay motivated combine verbal support,	Duration (15minutes)-> Brown Noise When performing the training session in the gym, listen to at least 15 minutes of brown noise, especially when you feel anxiety levels rising, to enhance concentration and overall training performance by calming the nervous system	Duration (10minutes)-> Meditation Music 1.Find a peaceful **environment with minimal interactions** 2.Take a comfortable seat or lie down on the floor 3.Keep your focus in the present while paying attention to each slow inhalation and exhalation you take 4. As you become comfortable, progressively increase the duration of your position from the initial 5 to 10 minutes	Duration (10minutes)-> Empowerment music (to listen when visualizing) 1)Close your eyes and choose a quiet **environment** to sit or lie down 2) To calm the mind and relax the body, take a few deep soft breaths 3) Imagine a takeoff that is confident and explosive, with a powerful drive during the takeoff leg

encouraging actions, and modest rewards 4. Continue to be enthusiastic and confidence while concentrating on personal improvement 5. while providing helpful advice on areas for each development, highlight each strength in same areas. 6. Recognize on daily basis.		5. Once 10 minutes it up, slow begin movement.	4) At takeoff, picture a strong arm thrust and complete hip extension 5) Imagine a controlled flight phase with a clear bear awareness, a powerful hip height, and an extended thoracic spine 6) Imagine yourself efficiently and neatly clearing the bar 7) practice this takeoff and flight pahse in your head repeatedly, emphasizing confidence and exact technique

Daily Session Reflections

	Client self-reflection	Coach reflection
1	I liked the take-off arm drive activities and the encouraging coaching since it helped me with my coordination and posture. My rhythm and confidence were impacted by my difficulties with a quick approach and sprint exercises, and I experienced anxiety when performing technical work. I needed more mental preparation, slower speed, and more understandable.	**Strong communication** was maintained throughout the practice, and she used breathing methods in particular to increase her take-off and bar clearing. However, she made rhythmic mistakes since the approach drills were too quick for her current level. Better pacing, more understandable demonstrations, and ongoing mental preparation will be the main topics of the following session.
2	My confidence and skill suffered because I felt uneasy in the gym and weights were too heavy. I was able to relax and refocus with the aid of progressive muscle relaxation. I would benefit from lighter loads and more understandable technique- focused demos in the next session.	Although the workout was planned, her depth and technique were hampered by the weights being too heavy for her. There can be more strain in the gym **environment**. Despite its us, relaxing wasn't entirely successful, from gathering results on her WHOOP device. In the following session, loads will be decreased, and more precise instructions will be given to enhance technique and self- assurance.
3	In the third session, I really comprehended the technical input, and the seminar was well-organized. But occasionally, anxiousness made me less consistent. I was able to unwind and refocus thanks to mindfulness. To increase consistency, mindfulness. To increase the consistency, mindfulness should be applied earlier and more often in the following session.	My client did a good job applying the criticism, but outside distractions made it difficult for her to stay focused and consistent. Although it was helpful, mindfulness was not always sufficient. Distractions will be progressively added to future sessions as mindfulness and attention cues are reinforced.
4	Going for the less heavier weights made me feel strong and more assured, especially when it came to take-off power. At higher intensities, though, I had trouble controlling my breathing. In order to keep stability and attention throughout the next session, I want to boost my confidence which I think can help me optimize my ability to perform well in high jump.	As per our previous session I decreased the weight as It was too heavy, which allowed my client to complete all exercises with safe form, but stability was impacted by uneven breathing control. Visualization boosted self-assurance. Consistent verbal prompts and structured breathing techniques will be incorporated into future sessions.
5	I felt more focused and confident throughout plyometric and take-off drills when I received positive praise. But occasionally, ambiguous instructions led to confusion. Clearer and more consistent **communication** could help me in future sessions to enhance my technique in high jump.	Her motivation and attitude were enhanced by positive reinforcement. But occasionally, unclear directions led to confusion. Clear repetitive **communication** will be a priority in future sessions
6	Brown noise improved my concentration by lowering worry and distractions. During my run-up, I had trouble slowing down, but I got better with criticism and demonstrations. More technical breakdown of approach control might be beneficial in the following field session.	There was a lot of work and focus, especially with the background noise under control. She had trouble with several dynamic exercises, though, because she didn't fully grasp them. Clearer demonstrations will be given prior to the commencement of exercises in future sessions.
7	I felt more stronger and was able to effectively control my exhaustion by practicing mindfulness and taking breaks. My strength and stamina increased. I made progress towards my strength and take-off targets throughout this session	Explosive motions and increasing overload increase strength and power. Meditation was used to strengthen mental attention. Her overall consistency and take-off power were successfully supported by this session.
8	During my Fosbury flop, I felt more assured and technically proficient, especially during the take-off and flight phases. I was psychologically and physically prepared by the methodical warm-up, and my body awareness increased as each segment was broken down. Compared to previous sessions, my takeoffs felt more controlled and fluid.	The technical exercises and organized warm-up greatly enhanced execution and coordination. Improved lumbar hyperextension was indicated by video analysis, and this progress was reinforced by focused drills. Her confidence and technical focus increased as a result of visualization, leading to more controlled and effective leaps.
